DETAILED ACTION

Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 1-8 are rejected under 35 U.S.C. 103(a) as being unpatentable over Murakami et al. (USP 6,148,118) in view of Ohsawa et al. (USP 5,991,450).

Regarding to claim 1, Murakami teaches or discloses a facsimile device (a image reading device of fig 1 and 2) comprising: inputting means (image reading unit 2 of fig 2) for inputting image data of a subject copy having a width in a main scanning direction larger than an A3-size width, (fig 3), see col.5, lines 45-50); reading means (scanner 2 of fig 1 and 2) for divisively reading lines of said image data in a sub-scanning direction by dividing said image data into divisional lines of data having a predetermined width, col.5, lines 40-45); image rotating means (control portion 63 of fig 28) for performing an image rotation with respect to each of said divisional lines of data so as to supply rotated divisional lines, see (col.16, lines 40-50).

Art Unit: 2626

Muralami et al. does not disclose an encoding means for encoding each of said rotated divisional lines into encoded data; and outputting means for outputting said encoded data.

Ohsawa et al. in the same area of image reading and processing apparatus teaches an encoding means (encoder 32 of fig 1) for encoding each of said rotated divisional lines into encoded data, col.4, lines 35-45; and outputting means (sheet 38 of fig 2) for outputting said encoded data, (col.4, lines 18-23).

Therefore, it would have been obvious to a person with ordinary skill in the art at the time the invention was made to have modified the imaging apparatus of Murakami et al. to include: an encoding means for encoding each of said rotated divisional lines into encoded data; and outputting means for outputting said encoded data.

It would have been obvious to a person with ordinary skill in the art at the time the invention was made to have modified the imaging device of Muralami by the teaching of Ohsawa et al. for the purpose of obtaining a perfect final image, for all the prints of different color to be exactly superimpose.

Regarding to claim 2, Murakami teaches or discloses a facsimile device (a image reading device of fig 1 and 2), wherein said reading means (5 of fig 2) divisively reads said lines of said image data in said sub-scanning direction by scanning a plurality of areas of said image data sharing an overlapping width predetermined in said sub-scanning direction col.5, lines 40-45.

Regarding to claim 3, Murakami teaches or discloses a facsimile device (a image reading device of fig 1 and 2), wherein said reading means (2 of fig 2) divisively reads said lines of said image data in said sub-scanning direction by dividing said image data of the subject copy at a predetermined page into said divisional lines of data (col.5, lines 40-45)

Regarding to claim 4, Murakami teaches or discloses a facsimile device (a image reading device of fig 1 and 2), wherein said reading means (2 of fig 2) reductively reads image data of a subject copy having a width larger than said A3-size width by reducing said image data as a whole to said A3-size width, when said subject copy is not at a page to be divisively read, (col.5, lines 40-45).

Regarding to claim 5, Murakami teaches or discloses a method step (a image reading device of fig 1 and 2) comprising: inputting step (image reading unit 2 of fig 2) for inputting image data of a subject copy having a width in a main scanning direction larger than an A3-size width, (fig 3), see col.5, lines 45-50); reading step (scanner 2 of fig 1 and 2) for divisively reading lines of said image data in a sub-scanning direction by dividing said image data into divisional lines of data having a predetermined width, col.5, lines 40-45); image rotating step (control portion 63 of fig 28) for performing an

Art Unit: 2626

image rotation with respect to each of said divisional lines of data so as to supply rotated divisional lines, see (col.16, lines 40-50).

Muralumin et al. does not disclose an encoding means for encoding each of said rotated divisional lines into encoded data; and outputting means for outputting said encoded data.

Osaka et al. in the same area of image reading and processing apparatus teaches an encoding step (encoder 32 of fig 1) for encoding each of said rotated divisional lines into encoded data, col.4, lines 35-45; and outputting step (sheet 38 of fig 2) for outputting said encoded data, (col.4, lines 18-23).

Therefore, it would have been obvious to a person with ordinary skill in the art at the time the invention was made to have modified the imaging apparatus of Murakami et al. to include: an encoding means for encoding each of said rotated divisional lines into encoded data; and outputting means for outputting said encoded data.

It would have been obvious to a person with ordinary skill in the art at the time the invention was made to have modified the imaging device of Duralumin by the teaching of Ohsawa et al. for the purpose of obtaining a perfect final image, for all the prints of different color to be exactly superimpose.

Regarding to claim 6, Murakami teaches or discloses a facsimile device (a image reading device of fig 1 and 2), wherein said reading means (5 of fig 2) divisively reads said lines of said image data in said sub-scanning direction by scanning a plurality of

Art Unit: 2626

areas of said image data sharing an overlapping width predetermined in said subscanning direction col.5, lines 40-45.

Regarding to claim 7, Murakami teaches or discloses a facsimile device (a image reading device of fig 1 and 2), wherein said reading step (2 of fig 2) divisively reads said lines of said image data in said sub-scanning direction by dividing said image data of the subject copy at a predetermined page into said divisional lines of data (col.5, lines 40-45)

Regarding to claim 8, Murakami teaches or discloses a facsimile device (a image reading device of fig 1 and 2), wherein said reading step (2 of fig 2) reductively reads image data of a subject copy having a width larger than said A3-size width by reducing said image data as a whole to said A3-size width, when said subject copy is not at a page to be divisively read, (col.5, lines 40-45).

3. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Negussie Worku whose telephone number is 571-272-7472. The examiner can normally be reached on 9am-6pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kimberly Williams can be reached on 571-272-7471. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
